Data Flow Diagrams (DFD)

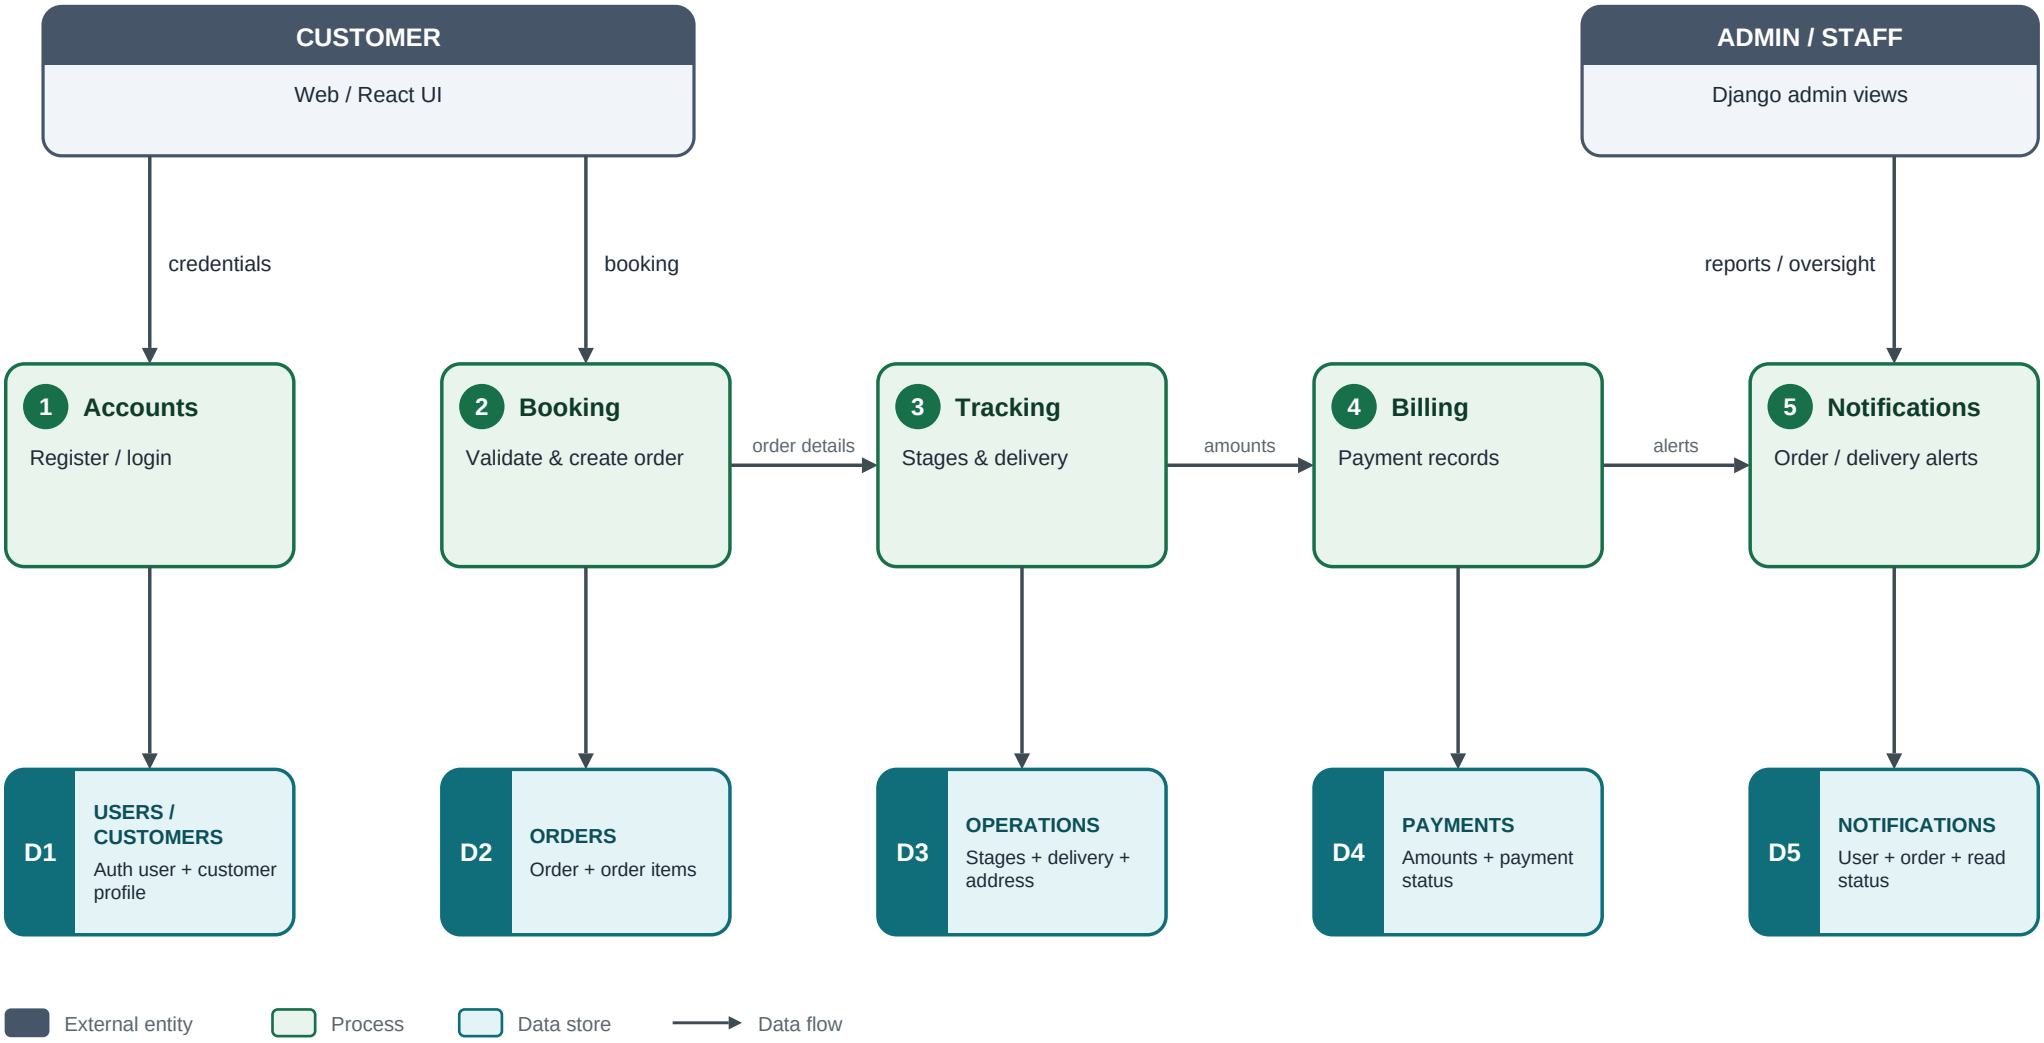
Conceptual data flows based on the supplied Django views, React booking UI, and model structure.

1 Context diagram (Level 0)

System boundary: React interface + Django views/templates + SQLite database

The customer sends account, address and booking information and receives dashboard, order, bill and notification information. Admin/staff review all customer orders and view operational/revenue summaries.

2 Level 1 data flow



Conceptual Level-1 view based on supplied models.py and views.py; data stores represent the Django/SQLite persistence layer.

Main processes

Process	Inputs	Outputs / stored information
1. Accounts & profile	Registration/login details; address details	Authenticated session, Customer profile, Address records
2. Order booking	Service, address, garment type, quantity, expected date	Order, OrderItem, initial ProcessingStage records, scheduled Delivery, pending Payment, Order Received notification
3. Tracking & delivery	Order ID and customer request; staff/admin updates	Order status, processing-stage status/timestamps, delivery status
4. Billing	Order totals, discount and advance amount	Payment total, discount, advance, pending amount, payment status
5. Notifications	Order and delivery events	Notification messages, read/unread state, timestamp
6. Admin reports	Date grouping and payment/order data	Daily order counts; total amount, discount, advance received and pending amount

Scope and assumptions

This diagram reflects the supplied code. Order booking creates a scheduled delivery and a pending payment record; the provided code does not establish an online payment gateway.

Django REST Framework usage has not been confirmed, so the DFD describes the observed Django views/JSON endpoints rather than claiming DRF.
